

System Integration.

SKIDDED

Skidded Integrated Packaged System

Stelter & Brinck **skidded integrated packaged systems** can save you weeks and months of installation and commissioning time. The system above includes 5 blowers, 2 AHG heaters, system fresh air inlet with filters, motor control center for the entire process, heat recovery heat exchangers and full system controls including transmitters and transducers. The package was custom designed by Stelter & Brinck for a catalyst manufacturer's newest production facility. Testing of all components and test-firing of the air heaters was done in our plant prior to shipment, thus making a very quick installation and plant start up possible.

MODULAR

Modular Integrated Packaged System

Our **modular integrated packaged systems** allow us to consolidate more than one skidded system. Multiple integrated skids are built to easily interconnect making the total system installation quick and start-up easy. The module above is one of seven integrated skids built by S&B, which comprised a mobile chemical weapons destruction system. When our customers transfer engineering, design, fabrication, test fire and field start up responsibilities to us, they can expand their ability to focus on their core business. Preserve your company's or your client's resources by allowing us to provide you with modular integrated systems.

>> *Low emissions options available on all integrated systems.* <<
